

Abstract of the Disclosure

For application number 10/657,571

Entitled "toenail fungal eradicator"

Inventor: Robert L. White

This is a device designed to illuminate a toenail or fingernail fungal infection for extended periods of time for the purpose of eradicating that infection. The device is battery powered and can be comfortably worn while sleeping (as would be probable in the case of toenail infections) , or can be worn continuously (as would be probable in the case of fingernail infections). The prolonged exposure to light will lead to the death of the fungus. This is non-invasive, and totally safe for the wearer.

The other effective method of treatment available consists of the ingestion of potentially toxic medication for extended periods of time.
